

Garden Blend

Garden Blend is a rich planting soil formulated to provide optimal root growth to support and sustain healthy plants. It is best suited for creating new planting beds and planting in general.

- High organic content composed of sustainable compost blend
- Optimum pH and water holding capacity

Typical Analysis:

- pH between 6.8 – 8.0
- EC: <3.0mS/cm
- Organic Matter Content: 25-35% by weight

Recommendations:

It is highly recommended, as with any soil, that plants are watered regularly to ensure optimum moisture content.

The addition of organic or synthetic fertilizer to soil will supply plants with additional nutrients to optimize plant growth. Fruit and vegetable plants are heavy feeders. Increased fertilizer may be required for crop yield. Fertilizer formulated for fruits or vegetables should be used to avoid excessive plant growth and optimum vegetable/fruit production.
